SUVARNA

JEWELLERY BUSINESS OS

One connected platform.
Stronger customer relationships.

A product overview for jewellery retailers exploring connected operations, customer engagement and AI-assisted growth.

JEWELLER WORKSPACE
Operations, inventory, billing, CRM, AI and follow-ups

CUSTOMER EXPERIENCE
Branded catalogue, AI concierge, enquiries and appointments

PRODUCT CONCEPT & PLANNED CAPABILITIES

Suvarna at a glance

Suvarna is being designed as a connected software platform for jewellery retailers. It brings together a jeweller-facing workspace and a mobile-first customer experience, with the aim of helping stores organise daily work, strengthen customer relationships and use AI-assisted workflows to identify and act on sales opportunities.

Two connected experiences

Jeweller Workspace

A responsive web portal for owners, managers, accountants and sales staff.

- Inventory, billing and business records
- Customer CRM, AI sales assistance and follow-up workflows
- Scheme administration, marketing and reporting

Customer Experience

A mobile-first storefront customers can open from a shared link.

- Browse jewellery, ask the AI Concierge and enquire
- Book appointments and save favourites
- Access eligible customer information securely

What Suvarna aims to help with

- Bring customer, product and sales information into organised workflows.
- Make it easier for customers to discover a store's collection and contact the showroom.
- Help staff manage enquiries, appointments and follow-ups consistently.
- Give owners better visibility into customer activity and business operations.
- Use AI to recommend explainable actions grounded in authorised business data.

Feature overview

The following pages outline planned capabilities. Availability will depend on implementation phase, subscription plan and required third-party integrations.

01 | JEWELLER WORKSPACE

A responsive web portal for owners, managers, accountants and sales staff.

Dashboard & business overview

- View sales, enquiries, pending tasks and operational indicators.
- See follow-ups and customer actions that need attention.

Customer relationship management (CRM)

- Maintain customer profiles, preferences and interaction history.
- Track enquiries from first contact through showroom visit and sale.
- Assign follow-ups, due dates, notes and next actions.
- Group customers for relevant, permission-based communication.

Jewellery inventory & catalogue

- Organise products by category, design, metal, purity and item identifier.
- Maintain product descriptions, images, SKU fields and pricing details.
- Capture gross, net and stone weights where applicable.
- Control product availability and visibility in the customer catalogue.

Billing, sales, purchases & exchanges

- Support sales-entry and point-of-sale billing workflows.
- Capture item details, discounts, taxes and charges using configured rules.
- Record purchase, exchange and buy-back details for review.
- Maintain invoice and transaction history with appropriate permissions.

Gold SIP / savings scheme administration

- Configure scheme terms and installment schedules.
- Track enrollment, due installments, receipts, balances and statements.
- Create reminders and follow-up tasks for upcoming or missed installments.

Gold & silver rate tools

- Display configured rates with timestamp and source information where available.
- Calculate indicative amounts by weight or target rupee value.
- Allow authorised staff to manage rates if no live provider is connected.

Accounts, expenses & reports

- Record operating expenses and basic ledger entries.
- Review sales, purchases, exchanges, scheme collections and customer activity.
- Export supported reports for reconciliation and accountant review.

Marketing, follow-ups & tasks

- Plan campaigns for launches, festivals and showroom events.
- Create tasks with owners, due dates, priorities and status.
- Track campaign responses where connected channels provide data.
- Respect communication permissions and opt-out preferences.

Branches, staff & administration

- Manage staff roles and access permissions.

- Support branch-level organisation and consolidated views where configured.
- Configure store details, branding and operational preferences.

Gold mortgage enquiries

- Capture enquiries, appointment requests and supporting notes.
- Route enquiries to authorised staff or an appropriate regulated lending partner.
- Keep indicative estimates separate from formal valuations or lending decisions.

02 | CUSTOMER EXPERIENCE

A mobile-first storefront customers can open directly from a shared link.

Branded jewellery storefront

- Mobile-friendly catalogue with product images and descriptions.
- Browse by category and view individual product details.
- Share product links and display store contact/location information.

Product enquiries & appointments

- Ask about price, availability, size, customisation or a design.
- Request a callback, showroom appointment or custom-order discussion.
- Route enquiries into the jeweller's follow-up workflow.

Wishlist & customer profile

- Save favourite designs when the customer chooses to use an account.
- Maintain relevant customer details and contact preferences.
- View supported enquiry or appointment status.

Gold & silver information

- View the store's configured rate board.
- Use indicative calculators for weight or target rupee amounts.
- Show timestamps and clear terms for indicative rather than live rates.

Gold SIP / savings plan view

- Review scheme information and terms supplied by the jeweller.
- Request enrollment or contact the showroom.
- Access installment information and statements when authenticated access is implemented.

Purchases, bills & support

- Access eligible purchase records and invoices after secure authentication is implemented.
- Ask about purchases, repairs, exchanges or orders.
- Request showroom appointments and customer support.

Gold mortgage enquiry

- Submit an enquiry or appointment request.
- Share only the information needed for the enquiry.
- No online enquiry implies loan approval or a lending commitment.

03 | CUSTOMER GROWTH WORKFLOWS

Connect customer interest to showroom action.

From product view to sale

- Customer opens a product link, enquires or books an appointment.
- Enquiry appears in the jeweller workflow for assignment and follow-up.
- Staff record the outcome to measure progress from enquiry to visit and sale.

Repeat-customer engagement

- Create appropriate customer groups using permitted data.
- Schedule campaigns and reminders for launches, festivals and milestones.
- Track follow-up completion and responses where data is available.

Operational visibility

- Give owners and managers a shared view of customer actions and pending follow-ups.
- Reduce dependence on scattered spreadsheets and individual staff memory.
- Support consistent processes across staff and branches as the platform matures.

04 | SUVARNA AI FEATURES

Planned AI capabilities designed to connect customer insight with measurable business action.

Priority 1 — Suvarna AI Sales Co-Pilot | Build first

- Review authorised CRM and sales data to produce a daily action list for the jeweller.
- Highlight enquiries with no recorded follow-up, bridal appointments, opted-in customer milestones and quotations needing attention.
- Link each recommendation to the relevant customer or task; let staff approve actions and track outcomes.
- Differentiation: connect recommendations to completed follow-ups, showroom visits and recorded sales.
- Business value: make Suvarna useful every day, not only when an owner opens a report.

Priority 2 — AI Lead-to-Sale Assistant | Build early

- Turn messages and enquiries into structured sales opportunities.
- Capture occasion, budget, preferred style and date; find matching items in the jeweller's actual catalogue.
- Draft a personalised reply, create a follow-up task and record whether the customer booked a visit or purchased.
- Use authorised catalogue and pricing data. Do not invent availability or promise an unverified price.
- Differentiation: a staff-supervised enquiry-to-outcome workflow with measurable conversion.

Priority 3 — AI Jewellery Concierge | Customer-facing

- Let customers describe what they want by text or supported voice input, for example traditional gold earrings under a specified budget.
- Filter real catalogue products by budget, category, metal, purity, design, occasion and available product details.
- Explain why products match and offer enquiry or appointment actions.
- Differentiation: personalised discovery using each jeweller's own inventory, with enquiries routed to the sales workflow.
- Recommend real catalogue items only; do not fabricate products or show unavailable stock as available.

Priority 4 — AI Repeat-Customer Radar | Retention intelligence

- Use authorised purchase history, enquiries, stated preferences and recorded interactions to suggest relevant follow-ups.
- Highlight unconverted enquiries, unfinished custom orders or quotations, expressed interest in related items and recorded upcoming milestones.
- Explain why each suggestion was generated and allow staff to dismiss it.
- Differentiation: actionable retention workflows with customer consent and communication preferences built in.

Priority 5 — AI Inventory & Demand Advisor | After data is reliable

- Analyse historical sales, enquiries, stock age, seasonality and current inventory.
- Highlight designs with rising enquiry levels, slow-moving categories, frequently requested unavailable designs and possible seasonal replenishment needs.
- Provide supporting evidence and uncertainty rather than guaranteeing future demand.
- Differentiation: connect customer demand signals to stock planning, not just historical sales totals.

Priority 6 — Voice-First Suvarna Assistant | Convenience

- Let authorised users ask in English, Hindi or Marathi for pending follow-ups, customers who enquired about a category, reminders or sales summaries.
- Query authorised business records and prepare actions through a conversational interface.
- Request confirmation before creating records, sending messages or changing consequential data, as appropriate.
- Differentiation: a practical conversational interface tailored to everyday jewellery-store workflows and local language preferences.

Priority 7 — AI Jewellery Marketing Studio | Growth add-on

- Generate WhatsApp campaign drafts, Instagram captions, product descriptions, festival messages and collection-launch content.
- Create content in English, Hindi or Marathi using verified product details.
- Suggest relevant customer segments and, where data is connected, track enquiries, appointments and recorded purchases from approved campaigns.
- Require approval before publishing or messaging customers; avoid unsupported claims.
- Differentiation: connect content generation to campaign outcomes rather than stopping at copy creation.

AI safeguards & implementation principles

- AI capabilities are planned features and are not represented as currently live.
- AI access must respect tenant isolation, role permissions, customer privacy and communication consent.
- Recommendations should be explainable, dismissible and grounded in authorised records.
- Use human approval for external messages and consequential actions; maintain appropriate audit logs.
- Inventory forecasting depends on reliable product, stock and transaction history.

05 | PLATFORM & INTEGRATIONS

One connected platform, delivered in stages.

Web portal + mobile-first customer experience

- Jeweller Workspace is planned as a responsive web portal.
- Customer Experience is planned as a mobile-first website / Progressive Web App (PWA).
- A PWA opens from a link and can be installed on supported devices; a native Android app may follow after customer usage is validated.

Shared platform foundation

- A common backend is intended to connect both experiences.
- Each jeweller's records must be isolated from other businesses.
- Authentication, permissions, backups, audit logs and secure data handling are production requirements.

Potential integrations

- Payment gateway and online payment status, if implemented.
- WhatsApp Business, SMS and email providers for approved communications.
- Gold/silver rate providers, accounting exports, barcode and printer integrations, subject to feasibility and provider terms.

Implementation approach

Suvarna is intended to be delivered in stages so useful workflows can be validated with jewellery retailers before advanced capabilities are introduced.

Stage 1 — Foundation and core workflows

Secure access, tenant separation, customer records, product catalogue, inventory, billing workflows, basic reports and staff permissions.

Stage 2 — AI Sales Co-Pilot and customer storefront

Daily action lists, follow-up suggestions, branded mobile-first catalogue, product enquiries and appointments.

Stage 3 — AI Lead-to-Sale Assistant and Concierge

Enquiry structuring, catalogue-grounded recommendations, draft replies and customer-facing product discovery.

Stage 4 — Retention, marketing and inventory intelligence

Repeat-customer recommendations, AI marketing assistance and demand insights after reliable data is available.

Stage 5 — Integrations and scale

Selected payment, messaging, rate-data, accounting, voice and multi-branch integrations based on validated demand.

Important scope notes

- This document describes the Suvarna product concept and planned capabilities. It does not mean every feature is currently live or production-ready.
- The current prototype is for demonstration and workflow discussion. Figures and records are illustrative. Do not assume live gold/silver rates, real transactions, payments, lending, secure production authentication, persistent database services or AI features are available.
- Rate boards depend on an appropriate data source or authorised manual configuration; rates should show a timestamp and relevant terms.
- Gold SIP or savings-scheme features are intended as administration and customer-information workflows. Terms, collection and redemption processes require legal and operational review before launch.
- Gold mortgage features are intended for enquiry and referral unless appropriate regulated lending arrangements are established. Suvarna does not imply loan approval or promise lending.
- AI recommendations depend on the quality and permissions of available data. Forecasts are estimates, not guarantees. Human review is required for external communications and consequential actions.
- External integrations are subject to provider availability, permissions, fees and implementation.

A practical next step

We invite jewellery retailers to discuss current workflows, operational challenges and customer-engagement goals. A discovery conversation can identify pilot use cases and confirm the capabilities, integrations and rollout plan relevant to each business.
